

## Tank Monitor

The Filedwise Tank Monitor is designed to monitor the level of a tank by providing real-time updates via the Fieldwise portal. Additionally, the Tank Monitor supports solar and communication to other Fieldwise products, such as the Valve Controller.

The Tank Monitor supports both 120VAC and 12V (solar) inputs, and has the ability to monitor pressure at the bottom of the tank by using a pressure transducer.

The Tank Monitor will execute an action, triggered by the Warning and Alarms, which are setup in the device settings. The operator can configure the Tank Monitor to trigger alerts to be sent for High and Low Warnings. In some circumstances it can trigger High and Low alarms to allow for in-field communication to a valve controller in the same field.

*The smarter way to control every drop!*

## FEATURES

- High Warnings
- High Alarms
- Low Warnings
- Low Alarms
- Full
- Empty
- Triggered Commands
- Real-Time Alerts
